

## Dentures

with Trish Rolfsen  
of Rocky Mountain Denture Clinic

**Q:** What are implant retained dentures?

**A:** Loose dentures can be remedied with the addition of implant anchors placed by a dental surgeon. Dentures are made to fit over implants which provide stability, increased chewing force, reduced tissue irritations and decreased bone loss. Implant retained dentures are no longer financially out of reach for the average consumer. Your denturist will help you in understanding the facts and procedures involved in implant dentistry and provide you with different implant options.
